# Apache Spark History Server Event Log Download Instructions

1. Go to the EMR console in AWS, and find the cluster that ran the job you are interested in optimizing. Click on the cluster name to view details of the cluster.

2. Once you are in the cluster information page, click on the "Application user interfaces" tab, and click on Apache Spark history server (in red below) under "Persistent application user interfaces."

3. A new tab should open up with the Apache Spark history server. It may take a minute to load. Click the download button under the event log column to download the Apache Spark event log. That is the event log we use for the Sync Auto-tuner.
